

TIMBER
WINDOWS

NORTH

Sound

Choose from our acoustic range of glazing which cuts down the noise from outside traffic.

A special acoustic interlayer is applied between 2 sheets of glass to catch specific decibels.

Draught proof

23 vinyl seals are concealed within each of our sash windows to ensure you have no draughts or rattles.

We hide all of the seals so that there are no unsightly brushes - something often seen when sash windows have been renovated.

Traditionally Weighted

Our sash are hung on weights & chains which removes the need for replacing damaged or stretched cords.

Efficiency

Slim Double glazed units are filled with Krypton gas and achieve an outstanding U-value of 1.0W/m²k

Glazing bars can be made down to 18mm to mimic the dimensions of most traditional English sash.

Condensation?

Warm edge spacer bars stop the transfer of cold to the inner pane which is one of the main causes of condensation. No more wiping your windows down every morning!

Longevity

Glazing is protected by a ventilation channel that stops premature failure of the unit.

Misting occurs when glass is set in a frame without adequate ventilation or when moisture builds up around the seal.

Secure

All glass is internally beaded. This simply means that the glass can't be removed from the outside but also increases longevity of the window.

Special Paint

Factory sprayed with a microporous paint which comes with a guarantee of 8 years. No more leaving windows open for weeks until the gloss paint dries.

FSC certified Wood

Available in a choice of 3 types of engineered timber with a guarantee of 30 years. Using engineered wood combats the movement associated with changes in moisture levels and keeps your sash sliding smoothly for years to come.
